A NEW BREED OF HOBBYISTS

For many years, the thought of having one's own digital computer was only a dream because they could cost anywhere from $100,000 to several million.

But in the late 1960's, Digital Equipment Corp. announced its $24,000 PDP-8, raising hopes of forward thinkers for that elusive home computer. With the 1970 introduction of the microprocessor IC (CPU-on-a-chip), representing the "heart" of a full-blown digital computer in a single IC package, they knew it was just a matter of time before prices dropped.

Not content to wait, amateur computer users banded together during the early '70s to share ideas and equipment. In fact, many of the successful applications of microprocessors on the market today owe their origination to these hardy souls, who experimented with building personal computers.

The breakthrough in low-cost microprocessors occurred just before Christmas 1974, when the January 1975 issue of POPULAR ELECTRONICS reached readers with the first relatively inexpensive unit—about $400 in kit form—that competed in performance with much costlier commercial units. The aftermath is heartwarming to electronics hobbyists—CPU prices are plummeting, and at least one major manufacturer drastically cut the price of its microprocessor.

People interested in computers fall into three major groups: (1) Strong background in "hardware," the physical electronics equipment; weak in "software," the instruction programs needed to make the computer perform some useful task. (2) Strong background in "software," weak in "hardware." (3) Interested amateurs who have no experience in either sector, but find the world of computers an exciting challenge they'd like to tackle.

So it's not surprising to learn that small hobbyist groups are springing up all over the country, where competent and enthusiastic programmers who cannot read a wiring or logic diagram share ideas with electronic engineers and technicians who work with computers daily, but still find the mysteries of software virtually a black art. For example, a recent letter addressed to POPULAR ELECTRONICS from Hal Singer (hardware editor) and Steve Diamond (software editor), Cabrillo Computer Center, 4350 Constellation Road, Lompoc, CA 93436, stated that they represent a user group of 300 hobbyists actively constructing microcomputers, and would like to encourage participation in their group by persons planning to build the Altair 8800 computer that debuted in POPULAR ELECTRONICS' January 1975 issue. The group published four newsletters, which can be received by sending a self-addressed manila envelope with 50c stamp to the address above.

**What's a Computer?**

A computer is a deceptively simple kind of device if you look at it from a "black box" viewpoint, not trying to understand all the electronic "innards."

All computers are fundamentally alike from the largest to the smallest. And the humblest of computers can perform the same work as a huge computer can, except that it takes more time to do it! With a suitable program (software) in its memory, a computer can be a game player, a home accounting machine, or an environmental controller; and in many cases, it can be all of these things at the same time.

No matter how large or small, a computer must have five basic elements, as illustrated.

1. The Arithmetic Logic Unit (ALU) performs additions, subtractions, and all the other arithmetical and logical operations on the input data (something on the order of a super calculator). It is the features of the ALU that determine the ultimate potential power of the computer.
2. The Control portion orchestrates the movement of data and instructions from one part of the computer to another by taking the operational instructions that were inserted (programmed) into the memory and using these to perform some function to change the input data to output data.
3. The Memory (more properly called Storage, but the two words are used interchangeably) is used to hold operational instructions for the computer, and store intermediate results, commonly used tables, and other pertinent data.
4. The Input Circuit allows the computer to accept data from the outside world. The actual input can come from a single sensor, a two-wire system, or a complex network of things to be monitored. Anything that can be converted into computer-acceptable data can be used as the input.
5. The Output Circuit delivers the data generated by the computer to some form of device that does the appropriate work. Without output capabilities, the computer serves no useful purpose.

The ALU and Control circuits are often combined and called a Central Processing Unit (CPU). Years ago, the CPU was awesome—a few feet high, a couple of feet deep, and several feet long. With the advent of large-scale integration (LSI), a complex CPU can now be contained within a single integrated circuit having 40 or less pins. Interestingly, there are now over 25 microprocessors to choose from, if you elect to build your own computer.

All of the current microprocessors have been described in a publication called "The New Logic Notebook," issued monthly. Its premier issue included a "Microprocessor Scorecard" that summarizes the major features of all known CPU's (since publi-

Now...the most enjoyable, do-it-yourself project of your life—a Schober Electronic Organ!

You'll never reap greater reward, more fun and proud accomplishment, more benefit for the whole family than by assembling your own Schober Electronic Organ.

You need no knowledge of electronics, woodwork or music. Schober's complete kits and crystal-clear instructions show you—whatever you are, whatever your skill (or lack of it)—how to turn the hundreds of quality parts into one of the world's most beautiful, most musical organs, worth up to twice the cost of the kit.

Five superb models, with kit prices from $675 to around $2,200, each an authentic musical instrument actually superior to most you see in stores.

Join the thousands of Schober Organ builders who live in every state of the Union. Often starting without technical or music skills, they have the time of their lives—first assembling, then learning to play the modern King of Instruments through our superlative instructions and playing courses.

Get the full story FREE by mailing the coupon TODAY for the big Schober color catalog, with all the fascinating details!

Schober Organ Corp., Dept. PE-60
43 West 61st Street, New York, N. Y. 10023
[ ] Please send me Schober Organ Catalog.
[ ] Enclosed please find $1.00 for 12-inch L.P. record of Schober Organ music.
